

**To use the Omega system successfully, you need three things:**

- Mesh body or mesh head
- Omega relay
- Omega-compatible applier

**If your Omega-compatible applier is not working:**

- ◆ Make sure you have an Omega relay for your specific mesh body/head. If you don't have one, you may purchase it inworld at [Omega Solutions](#) or from the [Marketplace](#).
- ◆ Make sure you're in a place that allows outside scripts. If you see this icon  at the top of your viewer, it means your current location does not allow outside scripts.
- ◆ Make sure the Omega relay is attached.
- ◆ Make sure the layer you're trying to use is turned on. Even if it appears to be on, turn it off and back on.
- ◆ Turn off all layers. Turn layers back on.
- ◆ If you've recently updated your mesh body/head, you may have to install the Omega scripts again.
- ◆ Make sure your mesh body/head and Omega relay are up to date.
- ◆ Detach and reattach mesh body/head HUD and Omega relay. If you can't detach, you need to relog.
