

VoxPix ADVANCED «Song Request Handler»

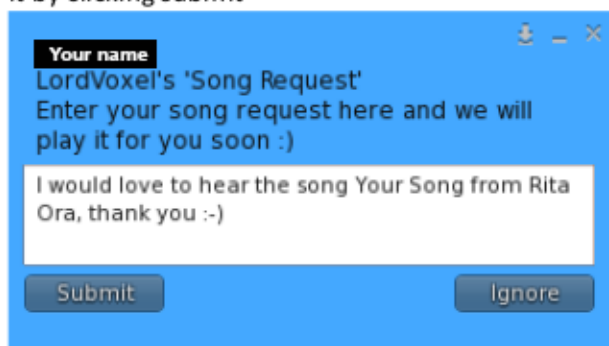

This song request handler is made to make your work as a singer or DJ much easier!!

You all know how much multitasking it needs to handle all the stuff during a gig...

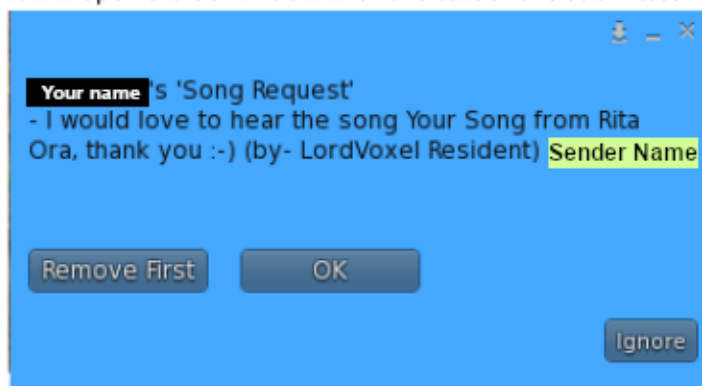

Checking the radar, greeting ppl, reading local chat, saying bye to leaving friends, preparing the next song, answering IMs and whatever more!

With this tool you have an easy control over all your song requests – easier than ever before!

- The person with a request simply clicks the “Song Request”, fills his text in popup menu he receives and sends it by clicking submit

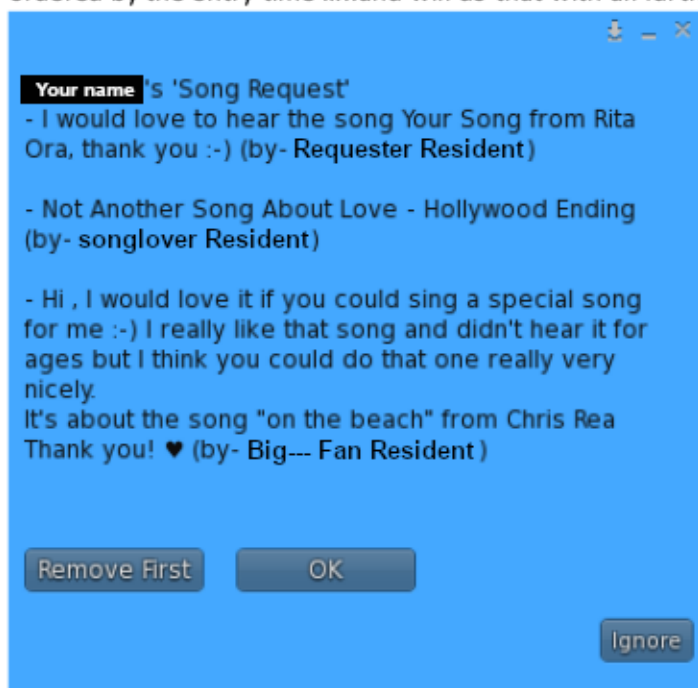

- It will open a blue window with the text of the submitted request plus the name of the sender

- It will also confirm the sender in local chat that his request has been transmitted and stored

[10:09] VoxPix Advanced "Song Request Handler" DEMO: Thank you very much, your request has been stored!

- If someone sends a second request, the tool will replace the popup with by a new one showing both requests ordered by the entry timeand will do that with all further requests

- After singing / playing the first entered request, you can remove it from the list simply by clicking the "Remove First" button

- if you close the window by clicking the OK button or by accident, you can get it back with a short key text in local chat (just type "/5 show")

That's it's EASIER THAN EASY

Some additional information:

- ❖ The Request Handler can manage long request texts up to 255 characters and still will show it in a clear way to you on the popup (the total of all requests is limited by 512 characters so don't tell the ppl they can put novels in 😊)
- ❖ The Request Handler will also work without any problems if several tipjars, with the VoxPix Request Handler, from different artists are used at the same time on the same place – each artist will get only his requests without changing any settings
- ❖ The Request Handler will also work when it's added on your avi – the same way as if it's rezzed
- ❖ The used script is very compact and low script impact, so you won't get lag by using it on your performance
- ❖ You will receive the tool as a script as well as a prim with the script inside (the prim will be Modify / Copy / NOtransfer, but the script is NOmodify/ Copy / NOtransfer)

In order to use the script on your tipjar you only add a prim on your tipjar and put the script in this prim, you can link it after – just make sure you will first click on the Request Handler prim and then your tipjar in order to keep your tipjar the mainprim and not to lose any functions.

For a demo just contact me in SL under LordVoxel Resident 😊
