

[*TA*] Slideshow scripts

Version: 1.1

Creator: tutti.anatine / 95eaa123-5b83-437e-9fe9-90def840da39

Set information

The provided scripts are stand-only drivers for picture slideshow frames. The fading variant will transition smoothly between pictures, whereas the simple variant plainly switches between images. The latter will be most suitable for use in laggy areas.

The scripts are made so you can create your own frame and installation around them. For easy use, four plug-and-play frames are included in the package.

The included frames support the auto-styling feature within the script, which coats an object in a single texture. This feature can be disabled to allow for personal designs.

The scripts switch between images based on a timer, or when the containing prim is touched. If only one image is inside the frame's contents, image switching will be disabled until more images are added.

License

All scripts and items in this set are provided free of charge. If you have paid for any of them, ask for a refund! You are free to use the code and items for your own purposes. However, if you wish to distribute one or more of the scripts, keep their license header in place and intact. Also keep the scripts full-perm.

Package information

Delivered in this package are:

- A scripts object containing:
 - Fading Picture Slideshow [script]
 - Simple Picture Slideshow [script]
- Four (4) picture frames, two (2) sizes per script.
- An updater

Instructions

Instructions specific to each script can be found inside the scripts, read these when you create your own slideshow object.

The included picture frames can be used as follows:

1. Rez the desired frame on the ground.
2. Right-click the frame and select "Edit" from the option wheel.
3. In the expanded Edit window, open the tab called "Contents". This should only contain one script at this point.

4. Drag textures or photos from your inventory to the Contents tab. Make sure these are items you can copy, else the frame won't display them.
 5. The frame should now be up and running.
- It is possible to tweak the display time and other options. To do this, open up the script within Contents. All values that can be tweaked are listed under the header "User settings". Each value is documented in the script.

Updating

To update this product, rez the included Updater on the ground. This item will check whether a product update is available. It is scripted to give out an update only once per twelve (12) hours, to prevent spam.
